

Disclosure of Generative AI Use

To	The Editorial Board, the Harvard Law Review
Re	Disclosure accompanying the article submission “Legally Subjective: How Much Vote Predictability Survives a Strong Ideological Baseline?”
Authors	Amine Harch El Korane · Ghali El Alj
Date	[DATE AT SUBMISSION]

In accordance with the Review’s policy on generative artificial intelligence, and specifically its requirement that any use of AI to draft text appearing in the submission be disclosed at the time of submission through a separate document identifying the tool and how it was used, the authors disclose the following.

Tool identified

The principal tool is **GLM, a large-language-model assistant by Z.ai** (versions through GLM 5.3), which served as the project’s working assistant across the preparation of the manuscript and its supporting materials. To the best of the authors’ knowledge as of the date above, no other generative-AI tool contributed text to the submission. *[AUTHOR CONFIRMATION REQUIRED before submission: confirm that no other tool (e.g., ChatGPT, GitHub Copilot, Grammarly) contributed, or add it here.]*

How the tool was used

- **Background research.** Locating and summarizing background materials in a search-engine-like role. Facts were independently verified by the authors against primary sources: published court opinions and docket records, the Supreme Court Database, CourtListener, and the cited literature.
- **Structural analysis.** Organizing the manuscript’s argument, sections, and internal coherence.
- **Drafting.** The tool produced draft passages of text, including passages that appear (in corrected form) in the submitted manuscript. This is the use the Review’s policy requires to be disclosed, and it is disclosed here without qualification.
- **Rewriting and copy-editing.** Revising and polishing author-reviewed text.
- **Code-related assistance.** Developing and debugging the analysis scripts, the corpus pipeline, the audit tooling, and the deterministic figure-generation scripts.
- **Tables and figures.** All nine figures are deterministic plots generated by committed scripts from frozen data artifacts; the assistant helped write those scripts, not the data.

For clarity, the language model that is the *object* of the study (Qwen2.5-3B-Instruct with per-justice QLoRA adapters) is a research instrument, not a writing tool; it produced experimental predictions (data), and no submission text originates from it.

Verification performed by the authors

The authors specified the experimental design decisions, the acceptance criteria, and the analyses to be run; they reviewed, tested, corrected, and rewrote the material produced with such assistance, and they take full

responsibility for the content of the submission. No reported number was accepted on an assistant's word: every figure regenerates from the committed scripts and hash-locked artifacts in the public repository, and the sealed-exam chain ran under the authors' control with a lock that is independently verifiable. The complete bibliographic apparatus (17 references) was verified against primary sources during submission preparation; one author-name error found in that check was corrected before the manuscript was finalized.

The authors are happy to provide any further detail the Review requires on the scope and the supervision of these tools.

Respectfully,

Amine Harch El Korane · Ghali El Alj
